

How to Embed an iFrame

To embed a link as an iFrame in VikingWeb, you need a Custom Content Portlet on your course page (About This Course portlet is a custom content portlet, or you can add a new one). Please refer to the resource titled Add a Portlet to a Page in the Other LMS Resources to learn how to add a portlet to a page. Also, you can refer to the About This Course/Custom Content resource under LMS Main Page Resources.

Important Note: An iFrame is an html element that allows a user to post a document inside an html document. You can use an iFrame to embed websites and YouTube videos on your course page.

1. Log in to VikingWeb

2. Navigate to your course

On the Main Page of your course, at the top of the left-hand column, you should see an 'About This Course' portlet.

3. Click Create Content in the About This Course (or other custom content portlet)

About This Course

There is no content in this portlet.

You can add content in the following way(s):

[Create Content](#)

4. Scroll down the page to the text box.

How to Embed an iFrame

At the bottom of the text box, there are two modes: Normal and html.

5. Switch to HTML

4. Copy & Paste the following code into the portlet (make sure you are in the html editor)

```
<p align=left><iframe src="http://www.whatever-website-URL-you-choose.com" frameBorder=0 width=800 height=700></iframe></p>
```

You can make changes to the code if necessary:

- `<p align=left>` : Change to left, right, or center according to your needs
- `src=http://www.whatever-website-URL-you-choose.com` : Change to whatever URL location you choose. Make sure you include `http://`
- `frameBorder=0 width=800 height=700` : Change width and height as needed. You may need to exit the edit mode and look at the page after changing these parameters to determine the best size. You may need to do this a few times until the iframe meets your needs.

5. Click Save and check your design.

How to Embed an iFrame

Example of an embedded website:

The site works like the actual website.
